8. Create a screenshot **100%**

9. On the Blog page search for the word "test" **100%**

10. Read out the date of the last entry and calculate how much days have passed since then **100%**

* it takes screenshots of required cards/testimonials, but beside that takes for each card +1 screenshot of card before the required one. So instead of 3 screenshots it makes 6.
In my opinion, based on the tings tried to make it work, when card slide, the edge of required card gives the program green light to take screen shot, and then again when the right card is displayed.
I've tried with multiple conditions, including position of the element on the screen based on x axis and left side of the screen and center of element to the center of page, both unsuccessful.
